

Task 1: 411 Ha Huy Tap, Yen Vien, Gia Lam, Ha Noi 25th, June, 2016 Dear Alex, Thank you for your delightful letter which came a short while ago. I'm Kim Ngan and I'm 19 years old. I've a younger sister, she's 14 years old. And now, I'll tell you about my favourite hobby. One of my hobbies is listening to music, especially English songs. My hobby started when I was a first - year student at Da Nang University of Technology. I spend much time on it. I can listening when I am doing my housework such as clean the floor, wash clothes, wash dish...or when I sleep...I love Taylor Swift, Rihana...they are great singers. I can learn English vocabulary when listening to English songs and it also make me feel relaxed. I'll tell you more next time.

Your sincerely, Kim Ngan Task 2: The designer village would be built from the combined knowledge of space-faring nations, including the US, and Russia. The MailOnline reports that the settlement would use natural resources from the moon's surface. This would be the centre for future scientific journeys as well as for business and space tourism. The settlement site could be either at the poles or on the far side of the moon where there is constant daylight, according to lunar experts. Although the South Pole is in continuous darkness, people in a settlement there would be able to access water to produce both oxygen and hydrogen. Mr Woerner also explained that in the shadow of the moon, future settlers could gain protection from solar and cosmic radiation. The location would mean that a radio telescope could be built with natural resources, instead of having to take up materials from Earth. In time, experts believe it could be used as a holiday destination for tourists. That would require collaboration among countries to contribute either robotic or human expertise. To start the settlement, builders would inflate a dome and then rovers could construct the building which would protect astronauts. Mr Woerner said they planned to initially introduce smaller landing missions. He said that while the US in particular had set their sights on going to Mars, he was adamant that a moon village was a closer reality.
