

Sunday, January 20, 2013 15:25 Maybe we do not have the opportunity to witness these changes. But nothing prevents scientists to figure out what might happen in the thousands, millions or billions of years from now ... 50,000 years later The burning of fossil fuels will bring fierce global warming. Earth will begin like a desert. The only place you can live a normal life at the poles. And you have to adapt to a long day about half a year. 50 million years later The result of the shifting tectonic plates, continental Africa will collide with the Eurasian mainland. Mediterranean will be only a memory. 150 million years later The continent will continue to drift, slowly closed the Atlantic and Indian Oceans. Pacific will become the Super Ocean. Antarctica Australia will stick.
