

Task 1: Hi, Alex, Thank you for your E-mail. Nice to meet you. My name is Anh - Nguyen Thi Hong Anh. My nationality is Viet Nam. I live in Ha Noi- the capital of Viet Nam- a wonderful city. I am 19 years old and I will be nineteen on the fifth of July this year. I live with my family now. There are 5 people in my family: my father, my mother, my young sister, my young brother and me. I'm the first- year student of Thu Do university. I am studying "Chinese". I really like it. My favourite hobbies are playing football, drawing and travelling. I usually play football with my friends after school. My favourite football team is Manchester United and German. I am very proud of my paintings. If you like to see them, I will send to you next E-Mail. In my free time, I often go camping with my family and my friends. Da Nang is a tourist destination that I like best. I want to travel more and more, and if I can travel abroad, I will visit Mendoza. I'm looking forward to your reply. Please write me soon and tell me about you. Best wishes Anh.

Task 2: With the development of science and technology today, more and more new things to be found. Someone says: " The moon and space will be popular places to go on holiday in the future". I really think about that and I believe that it will become a reality. The race for space will initially take travellers to Earth's low orbit allowing them to experience the stunning curvature of the globe from ultra-high altitude. The report's findings highlight the current Foster + Partners and ESA work exploring the possibilities of 3D printing to construct lunar habitations. Space lovers will also be able to visit sky resorts currently being developed that are set to contain zero-gravity spas, space gliders and space observatories where guests can experience weightlessness. Advances in technology mean that hotels will be able to provide incredible levels of hyper-personalisation for their guests, providing a tailored overnight experience. The report predicts that pillows with embedded electronics will provide sleep-aiding massages, rooms will be designed to reset the internal clocks of jet-lagged guests, and advances in technology will mean that guests can have unique experiences like jet-lag solutions such as shower water infused with Vitamin D. And forget any trips to the gym while you're on holiday - guests will be able to work out alongside a digital personal trainer in the comfort of their own room. I think that in 50 years time, it will be easier to travel, maybe safer. We might cover long distances in a very short time! Machines will divide travellers in tiny particles that will go from one part of the universe to another at the speed of light. I'll take my holidays on the moon . I'll go there with the particle machine and I'll take advantage of the sun with special sunglasses and I'll visit all the museums about Martians, and science fiction history. Since our childhood, I am sure that most of us have dreamt about travelling to different galaxies. Some nights, we open our window and watch the stars, wondering what it is like up there. We might find an answer to this question in a few years time. Because of technology all our wishes could come true. I think that in 50 years' time, we will be using different forms of transport like rocket or space shuttle to travel in an interplanetary world, because travelling on the earth will be a thing of the past. This new style of travel will take place in space, between the stars or on some other planet like Mars! We will meet extraterrestrials who live very far away from us. This fantastic discovery will change our lives because a lot of people will be very interested by that and by the new people who live there.
